# Menus, Tabbed Panels and Widgets

As a web site becomes larger with more pages linked, it can be a space saver to have some links or content hidden and set them to display when the user moves the mouse over a button or text link. In other words as a pop-up menu or tabbed panels. You can create pop-up menus and tabbed panels using a program such as FireWorks, however, DreamWeaver provides popup menus and tabbed panels as widgets, which are small pieces of code that allow you to add dynamic elements to your web sites. These can be edited and formatted. There are also third party widgets, such as Google Maps and a YouTube Player, that can added to your web sites. Think of a widget as a mini-program within the main program.

Popup Menus

A   Saving the Prepared Pages

Three Airline pages that have been prepared for you will need to be saved in your TRAVELWISE2 folder so that links from the popup menu items can be set to them.

1   Load DreamWeaver or close the current files and set the FILES panel to your TRAVELWISE2 site.

2   Display the FILE menu and select OPEN.

3   Access the CHAPTER 20 folder of the DWcs6 SUPPORT FILES and open the QANTAS.HTML page.

4   Use SAVE AS from the FILE menu to save the page in your TRAVELWISE2 folder under the same name. There is no need to update links, then close the pages.

5   Repeat steps 2 to 4 for the BA.HTML and SINGAPORE.HTML pages.
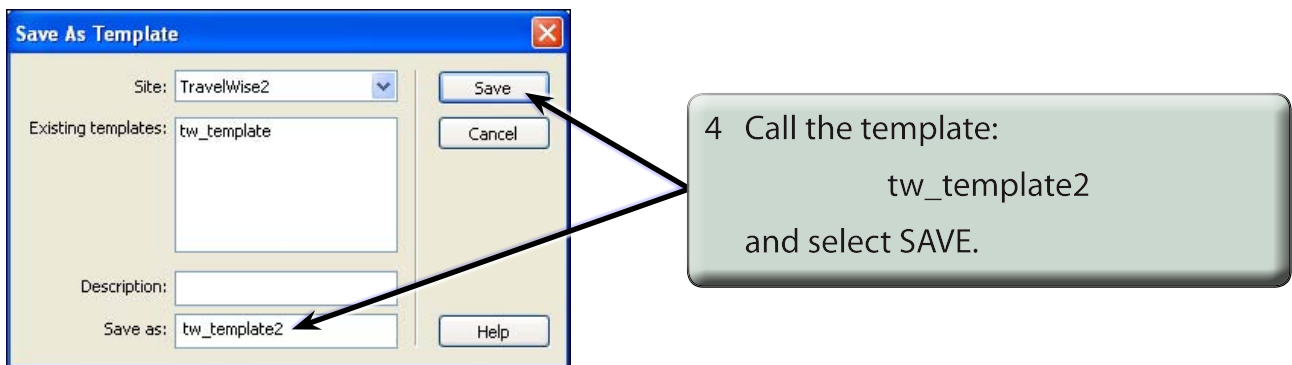

B   Adjusting the Template

The popup menu will be placed in the main navigation section of the template. The template will then be saved under a different name so that you still have a copy of the original template.

1   Open the TW_TEMPLATE.DWT file from the TEMPLATES folder of the FILES panel.

2   Delete each of the buttons from the NAVIGATION region under the banner.

NOTE: If the CONTENT region has been centred from the previous exercise, you can click in the CONTENT region and select the LEFT ALIGN button in the CSS section of the PROPERTIES INSPECTOR to left align it, then return the cursor to the NAVIGATION region.

3   Display the FILE menu and select SAVE AS TEMPLATE

4   Call the template:

tw_template2

and select SAVE.

C   Inserting the Popup Menu

The SPRY widgets are displayed in the SPRY tools within the INSERT panel.

1   Set the INSERT panel to the SPRY tools and click on SPRY MENU BAR.

2   Leave the HORIZONTAL menu bar selected in this case and select OK.

3   The menu bar is inserted in the NAVIGATION region.
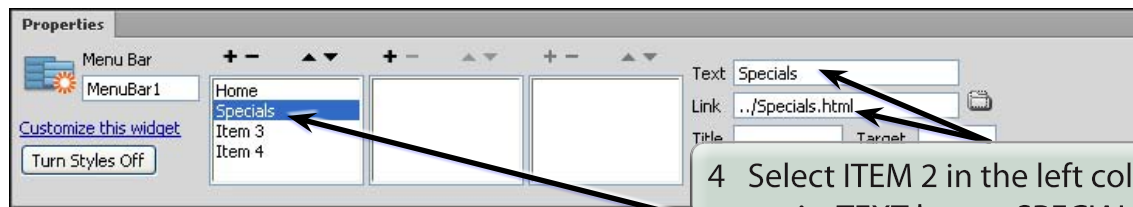

D   Adjusting the Menu Buttons

The text in the menu bar, the number of buttons and the sub-menus are all set in the PROPERTIES INSPECTOR. In this case we will create a menu bar with five buttons and set a popup menu on one of those buttons.

1   In the PROPERTIES INSPECTOR leave the MENU BAR name as MenuBar1.
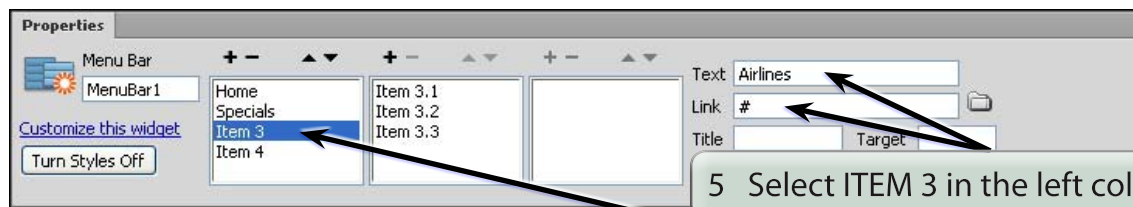

2   ITEM 1 should be selected in the left column, set the TEXT box to HOME and click on the BROWSE icon next to the LINK box
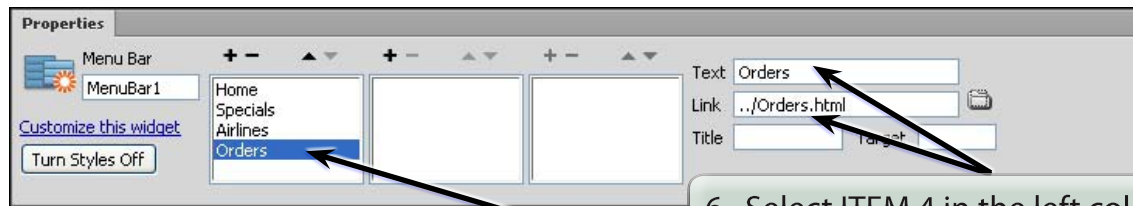

3 Select the INDEX.HTML page from your TRAVELWISE2 folder followed by OK to insert the link.

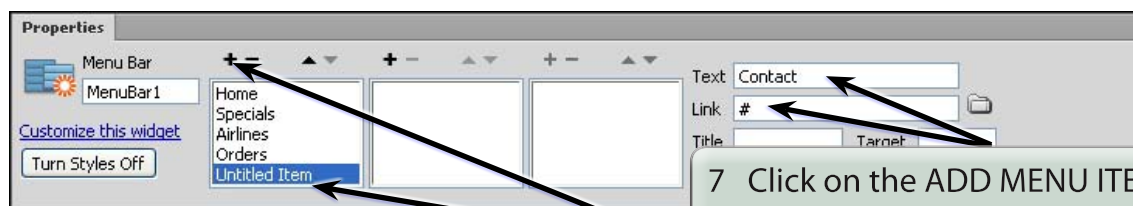

4 Select ITEM 2 in the left column, set its TEXT box to SPECIALS and its LINK box to SPECIALS.HTML.

5 Select ITEM 3 in the left column and set its TEXT box to Airlines, but leave its LINK box as #.

6 Select ITEM 4 in the left column and set its TEXT box to ORDERS and its LINK box to the ORDERS.HTML page.

7 Click on the ADD MENU ITEM button (+) at the top of the column to insert another button. Set the TEXT box to CONTACT and leave the LINK as #.
